SUMMARY

I build product software for mobile, web, and desktop apps, plus cross-platform applications with a bias toward clarity, maintainability, and real operational usefulness. The common thread in my recent work is software that has to carry actual workflow load: multi-role dashboards, content-heavy company platforms, internal manufacturing tools, and local-first utility suites. I am most useful in product engineering roles where interface decisions, content structure, and implementation details need to reinforce one another.

PRODUCT FOCUS

Workflow-oriented interfaces that make dense information easier to use, not just prettier to look at.

Product surfaces that span frontend, backend, and operational rules rather than isolated UI tickets.

Content systems where information architecture matters as much as visuals.

Delivery environments where maintainability, debugging, and future extension are part of the work from day one.

WORKING STYLE

Understand the domain before optimising the UI so the product solves the actual workflow instead of only looking polished.

Keep frontend structure, backend rules, and content architecture aligned so the software feels coherent to real users.

Prefer maintainable systems with clear extension paths over one-off hero implementations.

Stay comfortable moving between product framing, implementation detail, and final presentation quality.

CORE SKILLS

Full-stack web development (primary): React, Node.js, Express, MySQL, PostgreSQL

ADDITIONAL SKILLS

Web dependencies: Next.js, TypeScript, JavaScript, Vite, Tailwind CSS, Framer Motion, Material UI, React Router, TanStack Router, Prisma, Sequelize, REST APIs, auth, validation, uploads

Desktop development: .NET 8, C#, WinUI 3, Win2D, AssimpNet, MVVM, iText 7, screenshot and document workflows

Cross-platform and local-first: Flutter, Dart, Rust, Flutter Rust Bridge, FFI, on-device processing, encrypted storage, FFmpeg, multi-platform release

Data and delivery tooling: SQLite, Git, Docker, GitHub Actions, CI/CD pipelines, build and release workflow support

EXPERIENCE

Software Engineer — Product, Web & Desktop

Dec 2024 – Dec 2025

Printalyltix

Bengaluru, India

- Worked across customer-facing and internal product surfaces, from upload-heavy web flows to operations-focused tooling.
- Built and evolved **MIND** as a .NET 8 Windows application for 3D model inspection, manufacturing guidance, screenshot capture, and report generation.
- Delivered React and Node-based systems with protected workflows, validation, uploads, and maintainable product structure.
- Contributed across frontend, backend, and workflow design instead of staying in one layer of the stack.
- Helped shape software that supports real operational follow-through rather than just presentation.

Volunteer — Full-Stack Development

Oct 2023 – Jan 2024

Old Dominion University

Norfolk, VA, USA

- Built a university threads platform with role-based access, discussion flows, and real-time messaging.
- Delivered an examination management system covering assessment workflows, submissions, and administrative coordination.
- Worked on backend queries, caching, and application structure to keep the platform responsive as features expanded.
- Strengthened early full-stack foundations around auth, validation, role-aware UX, and shared-system design.

PROJECT HIGHLIGHTS

Pettige — Product developer | 2025 – present

- Local-first utility suite with **30+ tools** spanning PDF, image, audio, video, QR, OCR, storage, and developer workflows.
- Designed the split architecture between Flutter screens and a Rust core connected through Flutter Rust Bridge.
- Built dedicated PDF Studio, Image Studio, Audio Studio, Video Studio, and Dev Workbench flows instead of one generic tool list.
- Kept packaging, storage, and OCR paths in scope across Android, Windows, Linux, and Apple-platform targets.

Open Solar Toolkit — Frontend and product systems developer | 2025 – present

- Solar operations platform covering **7 workstreams** across administration, project management, sales, supply chain, installation, maintenance, and user dashboards.
- Approached the product as a set of specialised interfaces inside one shared system rather than a generic one-size-fits-all dashboard.
- Built around operational density, with drag-and-drop interaction support, charting, theming, responsiveness, and validation tooling already in scope.
- Demonstrates how I structure multi-role products so the shared system stays coherent while each workflow keeps its own shape.

MIND Manufacturing Intelligence — Desktop product developer | 2025 – present

- Windows desktop application for inspecting 3D models and supporting manufacturing decisions in one workflow.
- Worked across views, view models, rendering services, assets, screenshot capture, and PDF/reporting paths.
- Treated diagnostics and debuggability as first-class concerns because rendering-heavy internal tools need observability to remain maintainable.
- Shows range beyond web work into workflow-heavy desktop software where correctness and operator clarity matter.

Potential Client Website — Web platform developer | 2025

- Content-rich company platform for an animal-nutrition and biotech business with reusable data models for technologies, concepts, awards, and knowledge content.
- Structured the site so technical credibility, educational content, and future lead-generation flows can live in one maintainable system.
- Treated content architecture as a core engineering concern instead of leaving company information scattered across unrelated pages.
- Demonstrates how business websites can become structured product surfaces instead of thin marketing shells.

Resolute Solutions Site — Frontend developer and content systems builder | 2025

- Live multi-vertical business site spanning **4 service lines** with shared navigation, inquiry flow, and distinct presentation per vertical.
- Extended the housekeeping side into a more catalogue-like product surface instead of a generic marketing page.
- Carried the work through to production delivery with PWA support, build tooling, and deployment considerations.
- Shows how one codebase can support multiple visual identities without losing system coherence.

Printalytix Platform — Full-stack product developer | 2024 – 2025

- Full-stack workflow platform for customer intake, uploads, protected operations, and ongoing internal follow-through.
- Worked across frontend, backend, and data layers so validation, access rules, and product structure behave like one system.
- Helped modernise the frontend workflow while keeping richer form, table, and upload surfaces intact.
- Reinforces the kind of work I enjoy most: practical software that supports transactions and operations rather than isolated screens.

University Threads Platform — Full-stack developer | 2023 – 2024

- Earlier multi-user collaboration platform that still shows the foundations of my full-stack approach.
- Built around authentication, validation, rate limiting, logging, and role-aware behaviour instead of static page rendering alone.
- Useful because it demonstrates the base layer beneath later product work: shared systems, protected routes, and structure.

Personal Portfolio & Resume — Designer, writer, and frontend developer | 2025

- Built the main portfolio as a fast main route with deeper case studies, then added a cockpit mode for an interactive version of the same story.
- Structured the project data model so project work can be explained with more context and specificity than a bullet-only resume allows.
- Kept the resume workflow in the same repository so the web portfolio and downloadable assets stay aligned.

EDUCATION

Bachelor of Computer Applications (BCA) — Computer Science

Aug 2018 – Aug 2024

Bengaluru North University

Bengaluru, India

- 6 years: extended due to COVID-related semester delays and a 1-year gap.
- Built a foundation in DBMS, web development, data structures, and algorithms.
- Completed a final-year project centred on full-stack web application development with MySQL.
